SPECIFIC COMMENTS

Title: Identification of Teriparatide by SDS-PAGE

Comment Number	Specific Comments	Answer to Comments
2.	Introduction: The rationale for using SDS-PAGE is adequately described, but the novelty of applying SDS-PAGE to Teriparatide specifically could be emphasized further.	Some details have been added in introduction section in red color as per the suggestion
	Consider citing recent literature (2020 onwards) on analytical techniques for peptide therapeutics to strengthen the context	Some literature after 2020 has been cited in reference section
3.	Materials and Methods: It is recommended to include the number of replicates performed and any measures taken to ensure accuracy (e.g., validation of the method, use of controls).	As for the information to Editor, this method is verified at IPC several times. Some of data (best of two) is included in article.
5.	Discussion: Consider discussing how SDS-PAGE complements orthogonal techniques like mass Spectrometry or HPLC	The relevant content has been included in discussion part in red color.
	The novelty of the work is somewhat limited since SDS-PAGE is a well-established technique; discussing any specific challenges or optimizations encountered with Teriparatide would add value.	Percentage of gels, sample preparation prevents peptide diffusion and ensures sharp band migration. Additionally, the susceptibility of Teriparatide to aggregation, oxidation, and proteolytic degradation necessitates tailored handling and storage conditions prior to electrophoresis. These optimizations not only enable reliable visualization and assessment of Teriparatide integrity but also demonstrate the utility of SDS-PAGE as a complementary orthogonal method alongside mass

		spectrometry or HPLC.
6.	References: The references are relevant but include some older citations. It is advisable to update the literature with recent studies on Teriparatide analytics and quality control.	As per the suggestion, literature year 2020 onwards is included in Red color text.
